

# C Programming Final Module Test

## Q1 WAP to count the number of words in given string

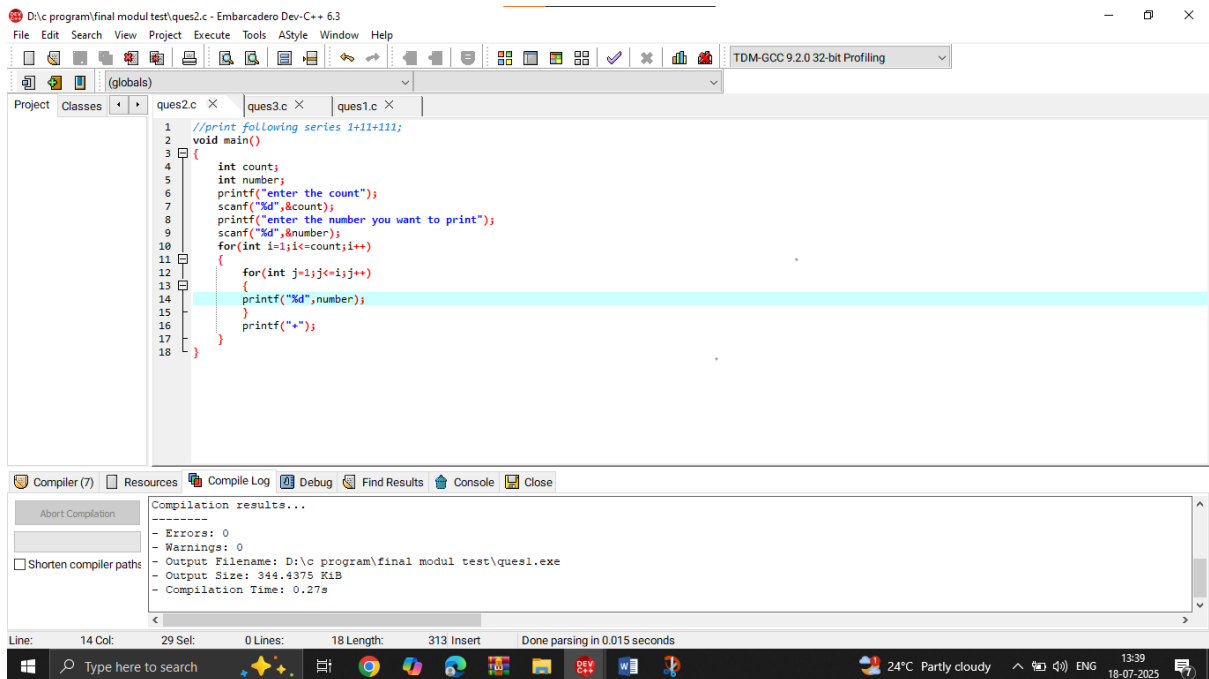

```
1 //count the number of words in string
2 #include<stdio.h>
3 void main()
4 {
5     char str[20];
6     printf("enter the string");
7     scanf("%s",str);
8     int i=0;
9     int count=0;
10    while(str[i]!='\0')
11    {
12        if(str[i]==' ')
13            count++;
14        i++;
15    }
16    printf("count of words is %d",count);
17    printf("count of words is %d",count+1);
18 }
```

## Q2 WAP to print following series 1+11+111+1111.... n

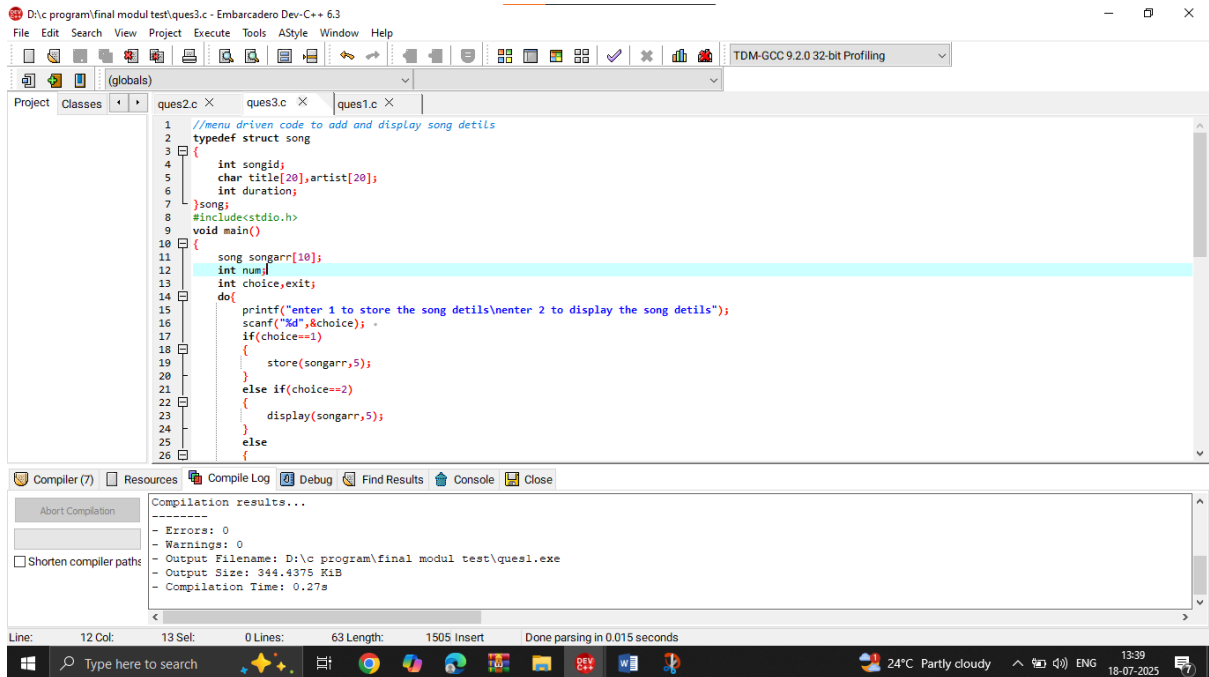

```
1 //print following series 1+11+111;
2 void main()
3 {
4     int count;
5     int number;
6     printf("enter the count");
7     scanf("%d",&count);
8     printf("enter the number you want to print");
9     scanf("%d",&number);
10    for(int i=1;i<=count;i++)
11    {
12        for(int j=1;j<=i;j++)
13        {
14            printf("%d",number);
15        }
16        printf("+");
17    }
18 }
```

Compilation results...

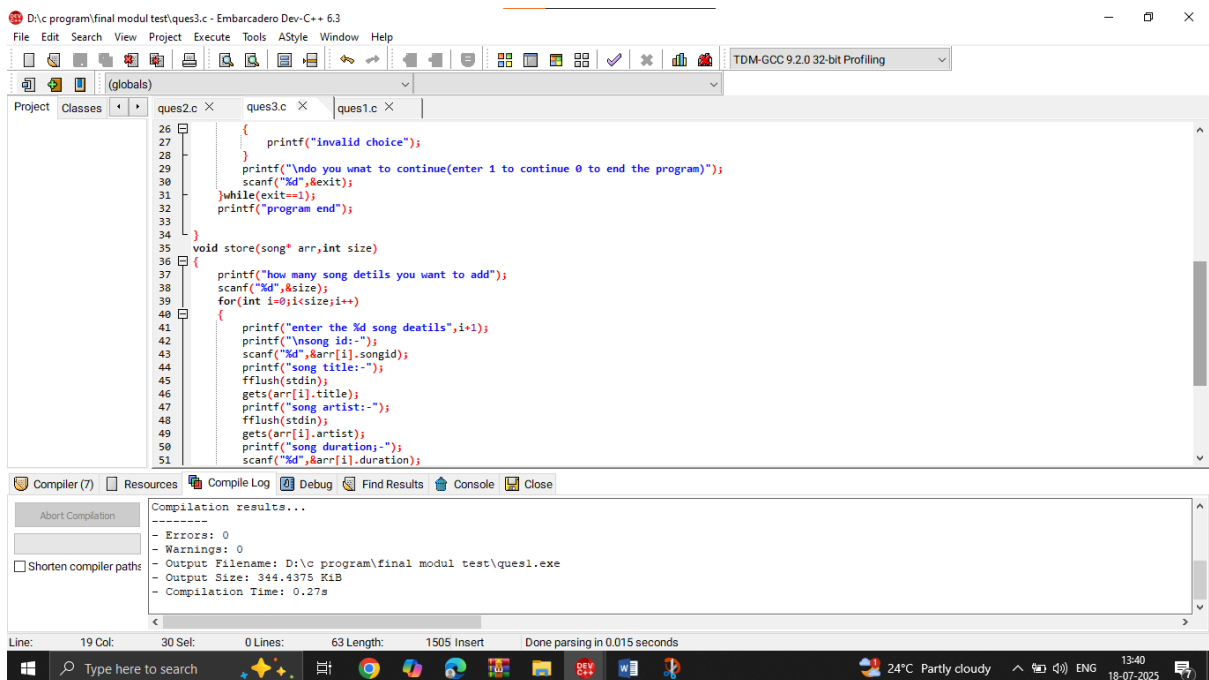

- Errors: 0
- Warnings: 0

- Output Size: 344.4375 KiB
- Compilation Time: 0.27s

### Q3 Menu driven code to add and display song details

The screenshot shows the first part of a C++ program in a code editor. The code defines a struct for song details and a menu-driven main function. The struct has fields for songid, title, artist, and duration. The main function uses a do-while loop to handle user input for adding or displaying song details.

```
1 //menu driven code to add and display song details
2 typedef struct song
3 {
4     int songid;
5     char title[20],artist[20];
6     int duration;
7 }song;
8 #include<stdio.h>
9 void main()
10 {
11     song songarr[10];
12     int num;
13     int choice,exit;
14     do{
15         printf("enter 1 to store the song details\nenter 2 to display the song details");
16         scanf("%d",&choice);
17         if(choice==1)
18         {
19             store(songarr,5);
20         }
21         else if(choice==2)
22         {
23             display(songarr,5);
24         }
25         else
26         {
```

The screenshot shows the second part of the C++ program, including the implementation of the store function and the while loop logic. The store function takes an array of song structures and a size, and prompts the user to enter details for each song. The while loop continues until the user enters 0 to exit the program.

```
26         {
27             printf("invalid choice");
28         }
29         printf("\ndo you want to continue(enter 1 to continue 0 to end the program)");
30         scanf("%d",&exit);
31     }while(exit==1);
32     printf("program end");
33 }
34 void store(song* arr,int size)
35 {
36     printf("how many song details you want to add");
37     scanf("%d",&size);
38     for(int i=0;i<size;i++)
39     {
40         printf("enter the %d song details",i+1);
41         printf("\nsong id:-");
42         scanf("%d",&arr[i].songid);
43         printf("song title:-");
44         fflush(stdin);
45         gets(arr[i].title);
46         printf("song artist:-");
47         fflush(stdin);
48         gets(arr[i].artist);
49         printf("song duration:-");
50         scanf("%d",&arr[i].duration);
51     }
```
